

Contents

1 Solving Linear Systems	1
1.1 Systems of Linear Equations	1
1.2 Triangular Systems	2
1.3 Matrices	2
1.4 Elementary Row Operations	3
1.5 Echelon Forms	4
1.6 Row Reduction	5
1.7 The Solution Set of a Linear Systems	7
2 Vectors and Linear Combinations	10
2.1 Vectors	10
2.2 Linear Combinations and Spans	11
2.3 Homogenous Systems and Parametric Vector Form	13
2.4 Linear Independence of Vectors	14
3 Matrix Operations	17
3.1 Basic Matrix Operations	17
3.2 Matrix Multiplication	18
3.3 Properties of Matrix Multiplication	19
3.4 Matrix Transforms	20
3.5 The Inverse of a Matrix	21
3.6 Characterization of Invertible Matrices	23
3.7 Block and Diagonal Matrices	23

4	Determinants	27
4.1	Introduction to Determinants	27
4.2	A Definition of Determinant	27
4.3	Recursive Formula: Cofactor Expansion	29
4.4	Properties of Determinants	30
4.5	Applications of Determinants	31
5	Subspaces, Bases, and Dimension	33
5.1	Sets Closed Under Operations	33
5.2	Subspaces	34
5.3	Bases	35
5.4	Dimension	36
6	The Three Matrix Spaces and Coordinate Systems	39
6.1	The Three Matrix Spaces	39
6.2	Bases for the Three Matrix Spaces	40
6.3	Coordinate Systems	41
6.4	Changing the Basis	42
7	Vector Spaces and Linear Transforms	44
7.1	Vector Spaces	44
7.2	Spans, Linear Independence, and Subspaces	45
7.3	Linear Transforms	46

8 Eigenvalues	49
8.1 Eigenvalues and Eigenvectors	49
8.2 Properties of Eigenvalues and Eigenvectors	51
8.3 Similarity and Diagonalization	52
8.4 Complex Eigenvalues	53
9 Orthogonality and Projections	55
9.1 Dot Products and Orthogonality	55
9.2 Orthogonal Complements	56
9.3 Orthogonal and Orthonormal Sets	57
9.4 Projections	58
9.5 Iterative Orthogonalization	59
10 A Taste of Further Applications	62
10.1 Ranking Sports Teams and Websites	62
10.2 An Introduction to Error-Correcting Codes	63
10.3 Principal Component Analysis	65
10.4 Some References	66
