

# PPM IMAGES

CPSC 1010 Fall 2015

# OVERVIEW

- ▶ Stands for Portable Pixel Map
- ▶ They have a simple format
- ▶ You will need a specific viewer to view ppm
- ▶ Gimp works for Windows, Mac, or Linux (little slow)
  - ▶ I will use gimp to test your programs
- ▶ IrfanView ([www.irfanview.com](http://www.irfanview.com)) works for windows as well
- ▶ Images contain two important things
  - ▶ header
  - ▶ group of pixels
    - ▶ each pixel has three values RGB (red, green, and blue)

# LITTLE MORE ABOUT IMAGES

- ▶ There are various type of image format; we will concentrate on PPM
  - ▶ PPM supports full-color images. Reads either pbm, pgm, or ppm formats, writes ppm format
- ▶ Couple others in the same family as PPM:
  - ▶ PGM - supports greyscale images
    - ▶ reads either pbm or pgm format and writes pgm format
  - ▶ PBM - supports monochrome bitmaps (one bit per pixel)

# PPM HEADERS

# EXAMPLES OF HEADERS

P6 1024 788 255

or

P6

400 400 255

or

P6

#This is a comment

400 400 #This is another comment

255

You can add comments using #comment

DO NOT PUT A SPACE AFTER 255

```
P6
2 3 255
0 0 0 255 255 0
0 255 0 0 0 255
0 255 0 255 255 255
```

Header

Binary data

P6: tells the computer it is a ppm file  
2: tells the computer the width (columns) of the image is 2 pixels  
3: tells the computer the height (rows) of the image is 3 pixels  
255: tells the computer the maximum color value (this is always 255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

Header

Binary data

P6: tells the computer it is a ppm file  
2: tells the computer the width (columns) of the image is 2 pixels  
3: tells the computer the height (rows) of the image is 3 pixels  
255: tells the computer the maximum color value (this is always 255)

The remainder of the file is binary data

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

Header

Binary data

P6: tells the computer it is a ppm file  
2: tells the computer the width (columns) of the image is 2 pixels  
3: tells the computer the height (rows) of the image is 3 pixels  
255: tells the computer the maximum color value (this is always 255)

Conceptually, you can think of the binary data as a consecutive set of bytes

Each set of three bytes represents a pixel

Each pixel represents a color channel (RGB)

P6

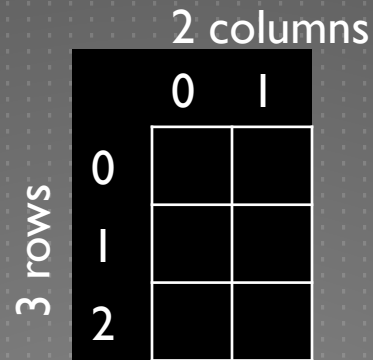

```
2 3 255
0 0 0 ← 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

If I were to "decode", each set of three would represent a pixel, with the bytes in this order:

Amount red (0-255)

Amount green (0-255)

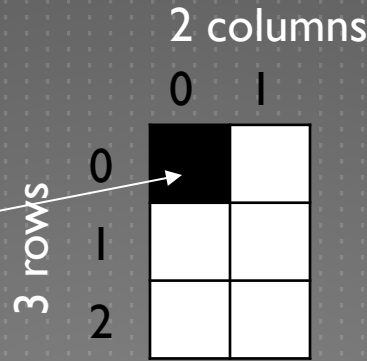

Amount blue (0-255)

Each set of three after that determines the color of a pixel in this order:

Amount red (0-255)  
Amount green (0-255)  
Amount blue (0-255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

0 red, 0 green, 0 blue = black

Each set of three after that determines the color of a pixel in this order:

Amount red (0-255)  
Amount green (0-255)  
Amount blue (0-255)

```
P6  
2 3 255  
0 0 0 255 255 0  
255 0 0 0 255  
0 255 0 255 255 255
```

255 red, 255 green, 0 blue = yellow

Each set of three after that determines the color of a pixel in this order:

- Amount red (0-255)
- Amount green (0-255)
- Amount blue (0-255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

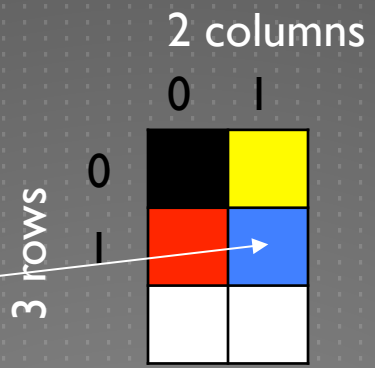

255 red, 0 green, 0 blue = red

Each set of three after that determines the color of a pixel in this order:

- Amount red (0-255)
- Amount green (0-255)
- Amount blue (0-255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

0 red, 0 green, 255 blue = blue

Each set of three after that determines the color of a pixel in this order:

- Amount red (0-255)
- Amount green (0-255)
- Amount blue (0-255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

0 red, 255 green, 0 blue = green

Each set of three after that determines the color of a pixel in this order:

- Amount red (0-255)
- Amount green (0-255)
- Amount blue (0-255)

```
P6
2 3 255
0 0 0 255 255 0
255 0 0 0 0 255
0 255 0 255 255 255
```

255 red, 255 green, 255 blue = white

# LET'S LOOK AT SOME CODE

- ▶ (ppm\_fun.c)
- ▶ How many bytes does it take to create a 400 X 400 image?
- ▶ convert ppm to jpg
- ▶ in terminal type:

convert filename.ppm filename.jpg

This should work in linux and mac not sure about windows

# COUPLE COOL PROCEDURALLY GENERATED PPM IMAGES
